

AvocadoNDR Edge E200

IT/OT Visibility and Compliance Evidence for Semiconductor Operations

Model: AVN-E200-M

For wafer fabs and equipment suppliers, connect equipment-side IT/OT observations with centralized investigation and evidence management. Review communications and risk across control hosts, PLCs/HMIs, engineering workstations and facility networks.

Map Equipment Relationships Relate observed assets and cross-layer communications through passive inventory and Purdue views.	Prioritize Remediation Combine risk, asset criticality and source evidence to focus equipment, facility and security teams.	Prepare Compliance Evidence Link equipment history and findings to evidence for applicable SEMI E187 requirements and IEC 62443 controls.
---	---	---

Product Technology and Deployment Scope

Core cybersecurity technology	AvocadoAI combines passive visibility, risk analysis, and traceable evidence.
Industrial-grade hardware	Industrial-grade hardware options are selected for the deployment scope.
Protection-relay scenarios	IEC 61850 protection-relay communications can be reviewed against the agreed deployment scope.

AvocadoAI Core Capabilities AvocadoAI combines IT/OT and AI Agent context with AI-assisted analysis and traceable evidence. Controlled verification, human approval and clear data boundaries support accountable security operations across existing tools.

From Equipment to Operations and Evidence

No agents are required on monitored PLCs/HMIs. Authorized PCAP files can be analyzed locally on E200.

Support the Semiconductor Equipment Lifecycle

Customer Workflow	Solution Value
Equipment suppliers: shipment and fab entry	Assess authorized packet captures to review equipment communications and risk, and prepare traceable customer handover evidence.
Wafer fabs: daily operations	Observe equipment, engineering workstations and facility networks to support joint investigation of unexpected connections and cross-layer activity.
Maintenance: changes and review	Compare observations before and after maintenance. Relate equipment configuration, remediation items and follow-up evidence.

Visibility, Investigation and Evidence

Edge E200 provides equipment-side communication evidence and Operations supports centralized workflows. Add AI Agent and Fab Evidence for investigation, remediation tracking and equipment history.

Monitor	Receive mirrored traffic for continuous asset and communication-risk visibility.
Snapshot	Import authorized PCAP files for local equipment assessments, maintenance and audits.

Passive inventory and Purdue views relate observed roles, protocols and cross-layer communications. Retain unknowns where evidence is insufficient; authorized staff can correct layer assignments.

Seven Industrial Risk Categories

01 Unexpected external connections	02 Lateral activity	03 High-risk industrial protocols	04 Unexpected communications
05 Plaintext sensitive-data clues	06 Suspected ARP spoofing	07 File-transfer indicators	Policy and evidence guide review

Semiconductor Solutions and Options

Platform / Option	Model	Customer Value
Operations	AVN-P-OPS	Centralize devices, events, health and authorized workspaces. Connect observations with investigation evidence.
AI Agent	AVN-X-AGT	Use authorized evidence for queries, summaries and remediation recommendations, with unknowns and work records. Production-related actions follow permissions and approval workflows.
Fab Evidence	AVN-X-FAB	Link configurations, shipment/fab-entry/maintenance history and external host-check results to applicable SEMI E187 / IEC 62443 control evidence.

Solution Combinations Observe = E200 + Operations; Assist = Observe + AI Agent; Fab = Observe + Fab Evidence.

Agree on Your PoC Success Criteria

Agree on scope Select representative equipment, bidirectional mirror points, data policies and acceptance criteria.

Review evidence Use authorized PCAP or an isolated test network to review normal and risk scenarios.

Assess the fit Record measurements, evidence, capacity limits and remediation items to guide deployment.

Start a Semiconductor PoC

Contact AvocadoAI to agree on observation points, representative equipment, risk scenarios and evidence deliverables.

Functions, configuration, and options follow the agreed proposal and delivery scope. Visibility depends on mirroring, parsers, and encryption; raw packets remain local by default. Assess SEMI E187 applicability for Windows/Linux hosts within equipment; host checks use applicable tools. Purdue layers do not directly equal IEC 62443 zones/conduits. Evidence management does not replace conformity assessment.
